Indexing

2 Searching

Searching big text corpora

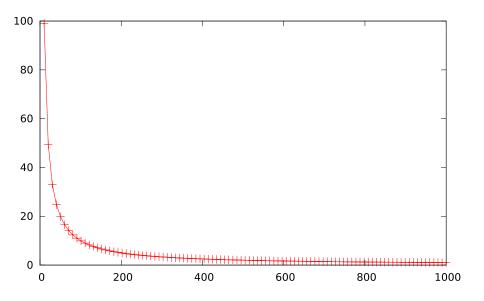

Corpus:

- positional attributes word form, lemma, PoS tag, ...
- structures and structure attributes documents (e.g. with author, id, year, ...), paragraph, sentence
- searching: Manatee/Bonito/Sketch Engine
- http://corpora.fi.muni.cz
- http://the.sketchengine.co.uk

Searching big text corpora

- data too big to be stored in memory
- data too big to be search sequentially
- ⇒ preprocessing needed (indexing, alias corpus compilation)
- key decisions are:
 - trade off between compile-time (preprocessing) and run-time
 - trade off between in memory and off-memory processing

Zipf's law I

Zipf's law II

• may be simplified to inductive definition:

Zipf's law (simplified)

frequency of the *n*-th element $f_n \approx \frac{1}{n} \cdot f_1$

- ⇒ frequency is inversely proportional to the rank according to frequency
- → one needs really large corpora to capture all the variety of many language phenomena
- ⇒ implications for text indexing

Zipf's law III

tag	Freq	
NN	161881	
NP	62669	
NNS	<u>56629</u>	
VVN	<u>27545</u>	
VV	<u>27481</u>	
VVD	<u>27391</u>	
VVG	<u>16922</u>	
VBD	<u>13275</u>	
VBZ	<u>11321</u>	
VVZ	<u>8254</u>	
VVP	<u>7912</u>	
VB	<u>6377</u>	
VBP	<u>5211</u>	
VHD	<u>5190</u>	
VHZ	2497	
VBN	<u>2470</u>

NPS	<u>1524</u>	
VBG	<u>674</u>	
VHG	<u>279</u>	
VHN	194	

Substantives + Verb tags on the Brown corpus

Building corpora

- ontent definition (what will it be used for? how do I get texts?)
- obtaining data (e.g. crawling)
- data cleaning (spam, boilerplate, duplicates)
- tokenization
- sentence segmentation
- further annotation (PoS tagging)
- o corpus indexing and analysis

Building corpora

- ontent definition (what will it be used for? how do I get texts?)
- obtaining data (e.g. crawling)
- data cleaning (spam, boilerplate, duplicates)
- tokenization
- sentence segmentation
- further annotation (PoS tagging)
- o corpus indexing and analysis

Corpus indexing

- text corpus is a database
- standard (=relational) database management systems are not suitable at all
 - text corpus does not have relational nature
- special database management systems needed
- ⇒ Manatee

Indexing corpora in Manatee

Key data structures for a positional attribute:

- lexicon
 - because operations on numbers are just so much faster than on strings
- corpus text
 - to iterate over positions
- inverted (reversed) index
 - ▶ to give fast access to positions for a given value

How to store integer numbers

- given Zipf's distribution: fixed-length storing very inefficient
- variable-length more complicated but yielding much smaller and quicker indices
- variable-length bit-wise universal Elias' codes: gamma, delta codes
- cf. Huffman coding

Indexing corpora in Manatee

Structures and operations:

- operations in between: string (str) number (id) position (poss)
- lexicon building: \Rightarrow word-to-id mapping \Rightarrow operations on numbers, not strings \Rightarrow id2str, str2id
- inverted index: id2poss
- corpus text: pos2id
- yields transitively also pos2str, str2poss

Searching corpora in Manatee

- key idea: operations on sorted forward-only streams of positions
- FastStream single position stream
- RangeStream stream of position pairs (structures: from position, to position)

CQL

- Corpus Query Language (Christ and Schulze, 1994)
- positions and positional attributes: [attr="value"]
- structures and structural attributes: <str attr="value">
- example:

established a within <str/> query:

[tag="
$$N.*$$
"]+ within $<$ s/>>

and alternative meet/union query:

```
(meet [lemma="take"] [tag="N.*"] -5 +5)
   (union (meet ...) (meet ...))
```

CQL in Manatee/Bonito

- ehnancements and differences to the original CQL syntax
- within <query> and containing <query>
- meet/union (sub)query
- inequality comparisons
- frequency function

within/containing queries

searching for particles:

```
[tag="PR.*"] within [tag="V.*"] [tag="ATO"]?
[tag="AJO"]* [tag="(PR.?|N.*)"] [tag="PR.*"] within
<s/>
```

 searching for a Czech idiom "hnout někomu žlučí" ("to get somebody's goat"): word-by-word translated as: hnout "move" [V, infinitive] *někomu* "somebody" [N, dative] žlučí "bile" [N, instrumental]. <s/> containing [lemma="hnout"] containing

[tag=".*c3.*"] containing [word="žlučí"]

within/containing queries

- structure boundaries: begin: <str>>, whole structure: <str/>, end:
 </str>
- changes: within <str> not allowed anymore, use within <str/>

meet/union queries

combined with regular query: <s/>

```
containing (meet [lemma="have"] [tag="P.*"] -5 5)
containing (meet [tag="N.*"] [lemma="blue"])
```

• changes: meet/union queries can be used on any position, they can contain labels and no MU keyword is required (and deprecated):

```
(meet 1:[] 2:[]) & 1.tag = 2.tag
```

Inequality comparisons

- former comparisons allowed only equality and its negation: [attr="value"] [attr!="value"]
- inequality comparisons implemented: [attr<="value"][attr>="value"] [attr!<="value"]
- intended usage: [tag="NN.*"] within <doc year>="2009">
- sophisticated comparison performed on the attribute value: <doc id<="CC20101031B"> matches e.g. BB20101031B, CC20091031B, CC20101030B CC20101031A.

Fixed string comparisons

- normally the CQL values are regular expressions
- sometimes this is not desirable (batch processing needs escaping of metacharacters)
- new == and !== operator introduced for fixed strings comparison
- no escaping needed except for '"' and '\'
- examples: ".", "\$", " matches a single dot, dollar sign and tilda, respectively, "\n" matches a backslash followed by the character n,

Frequency function

a frequency constraint allowed in the global conditions part of CQL:
 1: [tag="PP.*"] 2: [tag="NN.*"] & f(1.word) > 10

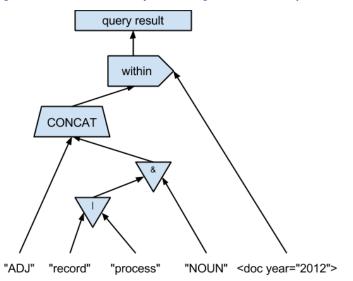

Performance evaluation

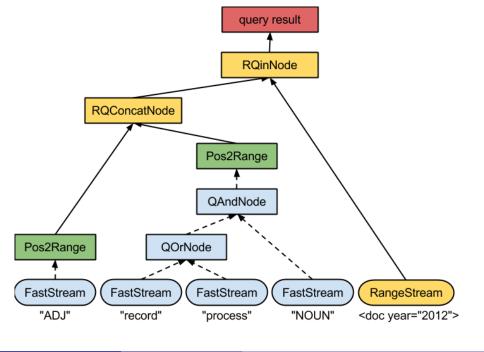

Table: Query performance evaluation − corpora legend: ○ BNC (110M tokens),
• BiWeC (version with 9.5G tokens), * Czes (1.2G tokens)

query	# of results	time (m:s)
o [lemma="time"]	179,321	0.07
o [lemma="t.*"]	14,660,881	3.12
∘ Ex: particles	1,219,973	33.36
• Ex: particles	97,671,485	32:26.48
* Ex: idioms	66	1:6.86
∘ Ex: meet/union	3	8.47
• Ex: meet/union	1457	7:13.12

CQL query evaluation

Example: [tag="ADJ"] [(word="record" | word="process") & tag="NOUN"] within <doc year="2012"/>

Today's Corpora in Sketch Engine

- LARGE (= billions of tokens, and it's going to be worse)
- complex multi-level multi-value annotation
- wide range of languages
- growing demand on complex searching moving from morphology to syntax and semantics
- search API for automatic information retrieval and post-processing in particular applications needed
