

# 04 – Named Entity Recognition

## IA161 Advanced Techniques of Natural Language Processing

Z. Nevěřilová

NLP Centre, FI MU, Brno

October 9, 2019

Washington: Ben Carson said Wednesday he's pulling in lots of money amid all the backlash he's received for remarks he made regarding Muslims in politics. The retired neurosurgeon said he raised \$1 million within 24 hours following the CNN debate on Sept. 16, and that donations have poured in after remarks he made over the weekend about Islam and the presidency. "The money has been coming in so fast, it's hard to even keep up with it," he said Wednesday morning on Fox News, when asked about whether his comments had affected his donations. "I remember the day of the last debate, within 24 hours we raised \$1 million. And it's coming in at least at that rate if not quite a bit faster." CNN will not be able to verify fundraising totals with the Federal Election Commission until after the quarter ends Sept 30.

# Outline

- 1 Named Entity Recognition
- 2 Named Entity Classification
- 3 Methods for NER
  - Gazetteer Methods for NER
  - Semi-supervised methods for NER
  - Supervised methods for NER
- 4 Evaluation of NER systems

# Named Entity Recognition (NER)

NER aims to **recognize** and **classify** names of people, locations, organizations, products, artworks, domain names, phone numbers, dates, money, measurements (numbers with units), law or patent numbers etc.

Named entities (NEs) can be **one word** or **multi word**.

[overlap with multi word expression (MWE) processing]

## Example

	NE	MWE
Brno	✓	✗
a priori	✗	✓
New York	✓	✓

# Named Entity Recognition (NER)

NER is vital for **information extraction** (IE).

## Example

MIT Press published a book by Patrick Hanks with the title  
Lexical Analysis: Norms and Exploitations. MIT Press published a book  
by Patrick Hanks with the title  
Lexical Analysis: Norms and Exploitations.

MIT Press published a book by Randy Thornhill and Craig T. Palmer  
entitled A Natural History of Rape: Biological Bases of Sexual Coercion

Lexical Analysis: Norms and  
Exploitations

Randy

Craig T.

A Natural History of Rape:

# Named Entity Recognition (NER)

Treating the whole multiword NE as one entity can improve advanced natural language processing:

Example

# NER: recognizing boundaries

## Example

Masaryk University in Brno

Masaryk University in Brno

Masaryk University in Brno

## Example

The Picture of Dorian Gray

The Picture of Dorian Gray

**Franz Válek**

Nová opera Vladimíra

Franze Válka s mloky ... Nová

# Named Entity Classification

Common classes: PERSON, ORGANIZATION, LOCATION

Less common classes: MONEY, PERCENT, DATE, TIME

Rare classes: ARTWORK, PRODUCT, ROLE

## Example

The White House	LOCATION? ORGANIZATION
Othello	PERSON? ARTWORK? PRODUCT?
Motorola	ORGANIZATION? PRODUCT?
The Pope	PERSON? ROLE?
two years ago	DATE? nothing?

The main problem is with [metonymy](#).

# Methods for NER

- gazetteer methods (list of NEs)
- semi-supervised machine learning (bootstrapping)
- supervised machine learning (training)

# Gazetteer Methods for NER

lists of NEs + substring search algorithms:

- list of names
- list of company names
- list of place names

search all occurrences of substrings  $S_k, \dots, S_l$  from lists of pattern strings  $P_1, \dots, P_p$  in a target string  $T[1 \dots m]$

Example algorithms:

- naïve multi-pass:  $O(p(m - n + 1))$
- improvements: Rabin-Karp, Boyer-Moore, Knuth-Morris-Pratt
- single-pass: Aho-Corasick:  $O(m + k)$

where  $p$  is the number of patterns,

$m$  is the target (searchable) string length,

$n$  is the average pattern length,

$k$  is the total number of occurrences of the pattern strings in the text

# Gazetteer Methods for NER

Problems: disambiguation + fixedness

## Example

May the force be with you!

I was born on May.

Karel May is my favorite writer.

## Example

Google was bought by Brand New So-far-unknown Company Inc.

# Semi-supervised methods for NER

bootstrapping = a small degree of supervision  
typically requires a small set of *seeds*

## Example

seeds: John, James, Steve  
search patterns in contexts:  
Peter, David, Michael ...

## Example

[Capitalized words and letters], the CEO of  
[Capitalized words and non-capitalized stop words],

Richard Rosenblatt, the CEO of Demand Media,

Michael Close, the CEO of Enterprise Training Centre,

...

# Semi-supervised methods for NER

good for discovering NEs (fixedness problem solved)  
but not good at disambiguation

# Supervised methods for NER

manually annotated training set  
manually annotated test set (the golden standard)  
+ optionally the gazetteer

discriminative vs. generative methods

Naive Bayes

**SEQUENCE**

HMMs

**GENERAL  
GRAPHS**

Generative directed models

Logistic Regression

**SEQUENCE**

Linear-chain CRFs

**GENERAL  
GRAPHS**

General CRFs

# Supervised methods for NER: Annotation

- XML-like annotation

Zpívali jí <ne type="oa">Krásnou <ne type="pf">Meredith</ne></ne>

token	simple	IOB	IOBSE
Alex	PER	B-PER	S-PER
is	O	O	O
going	O	O	O
with	O	O	O
Marty	PER	B-PER	B-PER
A.	PER	I-PER	I-PER
Rick	PER	I-PER	E-PER
to	O	O	O
Los	LOC	B-LOC	B-LOC
Angeles	LOC	I-LOC	E-LOC

- token-based annotation

# Evaluation of NER systems

precision, recall, F1-score

separate precision, recall, F1-score measurements for different classes

the less difficult classes are: DATE, MONEY, PERCENT

the most difficult classes are: PERSON, ORGANIZATION

Error analysis:

- errors in boundaries detection
- errors in class labeling

What is preferred: high precision (and low recall) or high recall (and more false positives)?
